

Microsoft

Almost every human being on the planet knows the name Microsoft. This trend-setting company has recently introduced Office 2019, an updated version of its Microsoft Office suite. Many of you may be wondering what is new in this update, so let's discuss the latest features of Office 2019.

- Microsoft PowerPoint is the most popular and commonly used software for presentations. Office 2019 adds advanced features to PowerPoint. Now users can create dynamic presentations with the help of Microsoft's enhanced Morph and Zoom capabilities.
- Microsoft Excel has also been enhanced in Office 2019. The management of data and analysis is much improved, and for the management of data new formulas have been introduced. New 2D maps and charts are available, as well as many more updated features to optimize the analysis of data.
- Some of you may be Microsoft Surface users and enjoy using the digital pen. This is very helpful for drawing, sketching, designing and writing notes directly onto the device's screen. By keeping this concept in mind, Microsoft introduced a new inking capability feature across all of its apps. This feature can identify pressure sensitivity and tilt effects and will adjust the thickness of the ink based on the angle of the pen, as well as introducing an additional roaming pencil case. This case will help to store its pens, pencils, ink thickness and different highlighters. This feature is compatible with all devices that support Microsoft Office 2019.
- Office 2019 also includes effective email management, such as updated contact cards, Office 365 Groups, @mentions, a focused inbox and travel package cards.
